SAXAPAHAW ISLAND PARK HABITAT RESTORATION

ALTR is collaborating on a project to restore the Saxapahaw Island Park's (SIP) habitat, foster community stewardship, and expand community educational opportunities. This project is consistent with ALTR's mission to foster community wellness through collaborative systems design and ecological stewardship.

HABITAT RESTORATION

The plan focuses on the removal of Chinese Privet and Tree of Heaven as a way to make native populations of plants more visually accessible and to restore habitat to the species originally growing on the island. The restoration of the island's landscapes will allow for a series of human and ecological initiatives to flourish.

PUBLIC SPACES

Saxapahaw Island Park has a diversity of public spaces, playgrounds, running trails and picnic areas. The island hosts educational courses, and organizes sports and recreation on the island. We are partnering with ALTA, a Durham-based design firm on developing a master plan for the island.

EDUCATION

As part of the ecological restoration, ALTR will work with the Educational Laboratory at the Hawbridge School to use the island as a living workshop for students and teachers. Students will learn about natural resource management while working with the land.
